

# DOCUMENTATION

## A. Running the Script

To run the FastAPI application, follow these steps:

1. Extract the files to a folder
  - main.py
  - address\_router.py
  - models.py
  - database.py
  - config.py
  - db\_utils.py
  - create\_sample\_db.py (optional)
  - view\_db.py (optional)
2. Open Command prompt in project directory.
3. Install the required dependencies by running the following command in your terminal or command prompt:  
`pip install -r requirements.txt`
4. Navigate to the project directory containing the `main.py` file.
5. Run the application using the following command:  
`uvicorn main:app --reload`

This command will start the FastAPI server and automatically reload the application.

When you make changes to the code, the `--reload` option watches for changes in the source code and restarts the server automatically.

6. Once the server is running, you should see output similar to the following:

```
'''  
INFO:   Uvicorn running on http://127.0.0.1:8000 (Press CTRL+C to quit)  
INFO:   Started reloader process [15124] using WatchFiles  
INFO:   Started server process [27832]  
INFO:   Waiting for application startup.  
INFO:   Application startup complete.  
'''
```

This indicates that the application is running and accessible at `http://127.0.0.1:8000`.

## B. Working with the FastAPI Swagger UI

1. With the FastAPI server running, open your web browser and navigate to `http://localhost:8000/docs`.
2. The Swagger UI should be displayed, showing the available API endpoints and their descriptions.
3. You can interact with the API endpoints directly from the Swagger UI. Each endpoint is documented with its parameters, request body, and response models.
4. To test an API endpoint, follow these steps:
  - Expand the endpoint by clicking on it.
  - If the endpoint requires request parameters, enter the values in the provided fields.
  - If the endpoint requires a request body, click on the "Try it out" button and enter the request body in the provided editor.
  - Click on the "Execute" button to send the request to the API.
  - The response from the API will be displayed in the "Responses" section below.
5. The application provides the following API endpoints:
  - a) POST /addresses: Create a new address.
    - Click the Try it out button.
    - Enter the address details in the Request body section, such as:

```
{  
  "name": "New Address",  
  "latitude": 40.7128,  
  "longitude": -74.0060  
}
```

- Click Execute to send the request.

The screenshot displays the Swagger UI interface for testing the POST /addresses endpoint. It includes a 'Curl' section with the command: `curl -X 'POST' \ 'http://localhost:8000/addresses' \ -H 'accept: application/json' \ -H 'Content-Type: application/json' \ -d '{ "name": "Address 1", "latitude": -60, "longitude": 60 }'.` The 'Request URL' is `http://localhost:8000/addresses`. The 'Server response' section shows a 'Code' of 200 and a 'Response body' of `{ "name": "Address 1", "latitude": -60, "longitude": 60 }`. The 'Response headers' are `content-length: 54`, `content-type: application/json`, `date: Thu, 16 May 2024 11:00:51 GMT`, and `server: unicorn`. A 'Download' button is visible next to the response body.

- b) GET /addresses: Get a list of all addresses.
  - Click the Try it out button.
  - Click Execute to send the request.

Curl

```
curl -X 'GET' \
'http://localhost:8000/addresses' \
-H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses

Server response

Code	Details
200	<p>Response body</p> <pre>[   {     "name": "Address 1",     "latitude": 0,     "longitude": 0   },   {     "name": "Address 1",     "latitude": 60,     "longitude": 60   } ]</pre> <p>Response headers</p> <pre>content-length: 108 content-type: application/json date: Thu, 16 May 2024 11:00:55 GMT server: uvicorn</pre>

- c) GET /addresses/nearby: Get a list of addresses within a certain distance from a given location.
- Click the Try it out button.
  - Enter the latitude, longitude, and distance parameters in the respective fields.
  - Click Execute to send the request.

Curl

```
curl -X 'GET' \
'http://localhost:8000/addresses/nearby?latitude=-60&longitude=60&distance=1' \
-H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses/nearby?latitude=-60&longitude=60&distance=1

Server response

Code	Details
200	<p>Response body</p> <pre>[   {     "name": "Address 1",     "latitude": -60,     "longitude": 60   } ]</pre> <p>Response headers</p> <pre>content-length: 56 content-type: application/json date: Thu, 16 May 2024 11:02:44 GMT server: uvicorn</pre>

- d) PUT /addresses/{address\_id}: Update an existing address.
- Click the Try it out button.
  - Enter the address\_id (Number) in the path parameter field.
  - Enter the updated address details in the Request body section.
  - Click Execute to send the request.

Curl

```
curl -X 'PUT' \
'http://localhost:8000/addresses/8' \
-H 'accept: application/json' \
-H 'Content-type: application/json' \
-d '{
  "name": "Address 2",
  "latitude": 0,
  "longitude": 0
}'
```

Request URL

http://localhost:8000/addresses/8

Server response

Code	Details
200	<p>Response body</p> <pre>{   "name": "Address 2",   "latitude": 0,   "longitude": 0 }</pre> <p>Response headers</p> <pre>content-length: 51 content-type: application/json date: Thu, 16 May 2024 11:04:08 GMT server: uvicorn</pre>

Curl

```
curl -X 'GET' \
  'http://localhost:8000/addresses' \
  -H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses

Server response

Code	Details
200	<p>Response body</p> <pre>[   {     "name": "Address 1",     "latitude": 0,     "longitude": 0   },   {     "name": "Address 2",     "latitude": 0,     "longitude": 0   } ]</pre> <p>Response headers</p> <pre>content-length: 105 content-type: application/json date: Thu, 16 May 2024 11:04:52 GMT server: unicorn</pre>

e) DELETE /addresses/{address\_id}: Delete an address.

- Click the Try it out button.
- Enter the address\_id (Number) in the path parameter field.
- Click Execute to send the request.

Parameters Cancel

Name	Description
address_id * required integer (path)	<input type="text" value="6"/>

Execute Clear

Responses

Curl

```
curl -X 'DELETE' \
  'http://localhost:8000/addresses/6' \
  -H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses/6

Server response

Code	Details
500	<p>Error: Internal Server Error</p> <p>Response body</p> <pre>{   "detail": "404: Address not found" }</pre>

Name Description

address\_id \* required  
integer  
(path)

Execute Clear

Responses

Curl

```
curl -X 'DELETE' \
  'http://localhost:8000/addresses/8' \
  -H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses/8

Server response

Code	Details
200	<p>Response body</p> <pre>{   "message": "Address deleted successfully" }</pre> <p>Response headers</p> <pre>content-length: 42 content-type: application/json date: Thu, 16 May 2024 11:05:35 GMT server: unicorn</pre>

Curl

```
curl -X 'GET' \
  'http://localhost:8000/addresses' \
  -H 'accept: application/json'
```

Request URL

http://localhost:8000/addresses

Server response

Code	Details
200	<div><p>Response body</p><pre>[   {     "name": "Address 1",     "latitude": 0,     "longitude": 0   } ]</pre><p>Download</p><p>Response headers</p><pre>content-length: 53 content-type: application/json date: Thu, 16 May 2024 11:06:02 GMT server: uvicorn</pre></div>

## NOTES

1. The application uses an SQLite database named **addresses.db** to store the address data. The database file will be created automatically if it doesn't exist.
2. The `create_sample_db.py` and `view_db.py` scripts are optional and can be used to create a sample database and view the database content, respectively.
